

DEVI Decrypt

Open Apple and iCloud returns offline

An offline Windows utility for decrypting Apple and iCloud OpenPGP provider returns.

At a glance

VERSION
v1.0.3

RELEASED
10/07/2026

PLATFORM
Windows (x64)

STATUS
Shipped

- Offline
- Source left alone
- Signed for Windows
- A PDF record of every decryption

Validate it under your lab's own procedures.

Key capabilities

- ✓ **Apple and iCloud returns**
Decrypts an Apple or iCloud OpenPGP return package, .gpg or .pgp.
- ✓ **The source is left alone**
The encrypted file is read only. It is not renamed, moved, or overwritten.
- ✓ **Return workspace**
Drop a whole Apple return and its key. Every OpenPGP file is decrypted and unpacked into one folder, then browsed and searched by category.
- ✓ **A built-in self-test**
Checks decryption against an embedded synthetic package.
- ✓ **Paste or load the key**
Paste the key block from the provider's email or load a key file, then add the passphrase if the key asks for one.
- ✓ **A PDF verification record**
Exports a record named by the full source SHA-256, with the source and output hashes. It never holds the key, the passphrase, or the decrypted contents.
- ✓ **A hash log of every output**
The workspace lists the SHA-256 of every source and output file, with a verification record for each decrypted file.
- ✓ **Offline**
Decryption runs on this computer and never uses the network.

Requirements

Operating system	Windows 11 (x64)	Runtime	Included in the download. No separate .NET install is needed.
Network	Not needed to decrypt. Used only for the optional update check.	Input	An Apple or iCloud OpenPGP provider return and its private key
Installer	49 MB, per user, no administrator rights needed	Portable zip	65 MB, no install needed
Code signing	Authenticode-signed through Microsoft Artifact Signing, with a timestamp.		

Verify the download Each published file has its SHA-256 on this page, with the Windows commands to check it.
